in the "Journal Officiel de Monaco" and posted in the head office of CMB and its branches.

The Net Asset Value of our funds is published and updated on a regular basis on our web page www.cmb.mc

Description

The fund is mainly invested in shares of listed companies performing activities in the fields of environmental technologies and services or related to environmental technologies and services, or activities in a field that enhances the compatibility of economic activity with the environment, or in shares of companies that consider environmental issues as of major interest in their policy or that voice their commitment to the community. The latter group of companies is included as a means of risk diversification, and does not contradict the fund's environmental specialisation; at all times, investments made in shares of such companies will be limited to 20% of the fund's overall assets, and all such companies must be part of the Dow Jones Sustainability World Index. Investments in shares of funds investing in financial instruments related to the environment, such as funds dealing in carbon gas emission rights, are authorised within a limit of 5% of the fund's assets. Depending on market conditions, the portfolio manager may invest a share of the fund's assets in money market instruments or keep it in cash.

Investment objective

The fund, denominated in Euros, is suitable for clients seeking exposure to stocks that benefit from the specific dynamics of the environmental sector. It is a financial instrument in which the client may invest a part of his assets, with a recommended investment period of at least 3 years. The objective of the fund is to generate capital gains in the long term. In the case where an investment for a shorter time horizon is realized, the client should be informed about the levels of volatility and risk inherent to stock markets in the short run.

Management style

The fund is managed actively. A dynamic management policy is enforced in order to optimize the fund's positions according to market conditions in the short term. The first step in the creation of the portfolio consists in an investment strategy which is split between an analysis of economic conditions and a detailed analysis of the markets, in order to define investment opportunities on a geographic and on a sector level. The fund seeks an optimum risk diversification with the objective to generate capital gains in the long term. A strategic committee composed of experts in energy, sustainable development and environmental activities advises the fund's manager on sector allocation policy with an objective of benefiting from future industrial trends. The second step consists in the selection of individual stocks, depending on their valuation, on their financial strength and on their long-term growth outlook. The fundamental selection of stocks is performed according to valuation ratios, and is completed by an analysis of the issuer's financial statements in order to ascertain that investments are made in financially sound companies. The fund is taking advantage of the cooperation with well known financial intermediaries and institutions to access top information about the identified companies and their businesses. The stocks held in the portfolio are monitored on a daily basis in order to manage efficiently the volatility of the markets.

Investment universe

The Strategic Committee will formulate proposals for strategic asset allocation among activities related to the fund's investment objective that include among others: water purification and supply technologies and services, waste disposal technologies and services, environmental remediation technologies and services, renewable energy producers and related technologies, and technologies and services that enhance management and efficiency in use of natural and energy resources, on a global basis.

MONACO ECO+ Monthly report

Market strategy

Equity markets underwent a correction in January, with the S&P500 losing -3.7%, the Eurostoxx300 -4.7% and Topix -0.7%. The global economic situation remained uncertain. Macro-economic data published in Western economies was generally poor, especially as regards employment. In addition, fears relating to the fragile economic situation in Greece, and its sovereign debt, weighed on the indices. Equity prices also felt the effects of the measures taken by China to curb its growth, especially in relation to credit levels.

The Environment sector, consisting mainly of cyclical companies, suffered in this correction. The renewable energy sector, in particular, had a difficult month in view of the prospect that solar energy production grants are to be reduced. However, infrastructure development in this sector continued, particularly with the granting of new operating licences for a UK programme of offshore wind energy valued at 120 billion dollars and consisting of the deep water construction of a network of turbines. In addition, it was noted that renewable energy investment in the Asia-Pacific region overtook the US for the first time with a figure of 37.3 billion dollars compared to the US 32 billion.

In view of the current situation, favourable conditions for the markets should continue during 2010 in Western economies. Investments in equities should therefore benefit from a relatively favourable environment over the year.

Main positions
